Cell death / apoptosis panel: RITA vs DMSO (per group)
169 cells padj<0.05 (*)
Apoptosis
Programmed cell death
Intrinsic pathway for apoptosis
Defective intrinsic pathway for apoptosis
Apoptotic execution phase
Apoptotic cleavage of cellular proteins
Apoptotic factor−mediated response
Diseases of programmed cell death
TNF signaling
TNFR2 non−canonical NF−kB pathway
Cell death signalling via NRAGE/NRIF/NADE
NRAGE signals death through JNK
Regulated necrosis
RIPK1−mediated regulated necrosis
Transcriptional regulation by TP53
Stabilization of p53
Regulation of TP53 activity
... through phosphorylation
... through acetylation
... through methylation
TP53 expression and degradation
TP53 −> cell death genes
TP53 −> cytochrome c release genes
TP53 −> cell cycle genes
TP53 −> G2 arrest genes
TP53 −> additional cell cycle genes
TP53 −> DNA repair genes
TP53 −> metabolic genes
G1/S DNA damage checkpoints
G2/M DNA damage checkpoint
Cellular senescence
Oncogene−induced senescence
Oxidative stress−induced senescence
DNA damage / telomere stress senescence
Senescence−associated secretory phenotype
Senescence−associated heterochromatin foci
WT
N1
T1
T4
T5
